

JavaScript Functions

Duration: 4 Hour

1-JavaScript Functions

Basic

1.Create a function that will display the smallest value in the array.

Example:

```
console.log(findSmallest([30, 45, 60, 7]));  
1
```

2. Function that will return your string in Alphabetical order

Example:

```
console.log(AlphabeticalOrder('hello'));  
"ehllo"
```

3. In mathematics, the factorial of a non-negative integer n , denoted by $n!$ is the product of all positive integers less than or equal to n . In simple terms, the Factorial of 8 is solved like this:

Example:

```
console.log(factorial(8));  
40320
```

4. A Write a function that lets you know if a number is Even or Odd .

Example:

```
console.log(oddOrEven(9));  
"Odd"
```

Mid

5. Return the sum of a number going back to it's root. In other words, the function will work like this:

Add Up(6);

$$6 + 5 + 4 + 3 + 2 + 1 + 0 = 21$$

Example:

```
console.log(addUp(8));  
36
```

6. Create a function that will accept an array and do the following:

- Get the lowest element
- Get the highest element
- Get the length of array
- Get the Average of all element;
- Store these criteria in a new array

Example:

```
console.log(minMaxLengthAverage([7, 13, 3, 77, 100]));  
[ 3, 100, 5, 40 ]
```

Advanced

7. Return how many words was given

Example:

```
countWords('hello from CodingAcademy!');  
3
```

8. Create function to Multiply all elements in an array by it's length

Example:

```
MultiplyByLength([4,2,5]);  
[12, 6, 15]
```

9. Create a function that will check if str1 ends with the characters in str2

Rules:

- Take two strings as argument
- Determine if second string matches ending of the first string
- Return Boolean value

Example:

```
console.log(checkEnding("CodingSchool", "Ac"));  
false
```

10. Create a function that will repeat each string character two times

Example:

```
console.log(doubleChar('Coding'));  
CCooddiinnngg
```

11. Return the index location of an element from a given array. First argument is the array you'd like to search and the second one is the element (either string/number) to look for.

Example:

```
console.log(findIndex(['Ali', 'Mazen', 'Ayham', 'Murad'], 'Ali'));  
1
```
