

Task 1

Restaurant Ordering System

Create a simple Restaurant Ordering System using HTML, CSS, and JavaScript

Requirements

Part 1 — Customer Information

Ask the user to enter

Name

Age

Gender

The gender should be male or female

Display a welcome message

Male → Welcome Mr. [Name]

Female → Welcome Ms. [Name]

Any other input → Welcome [Name]

Part 2 — Check Customer Eligibility

Check the customer's age

If the age is less than 16

Display "You are not eligible to place an order"

If the age is 16 or above

Continue with the order

Part 3 — Choose an Order

Ask the user to enter one of the following

Burger

Shawarma

Zinger

Check the entered order

If the order is one of the available options

Your order is being prepared

Otherwise

.Invalid order. Please try again

Part 4 — Logical Operators

Add the following rules

If the customer is 18 or older AND has a valid order

Display "Order confirmed"

If the customer is under 18 OR the order is invalid

Display "Order requires verification"

Use logical operators such as

&&

||

!

Part 5 — Display the Information

Use

`alert()` to display important messages

`console.log()` to display the customer's information

`document.write()` to display a final order summary on the page

The final summary should contain

Customer Name

Age

Gender

Order

Order Status

Extra Challenge

Add a variable called `isAvailable`

If the selected order is available

`isAvailable = true`

If it is not available

`isAvailable = false`

Use the variable with a condition to determine whether the order can be prepared

Important

Do not use arrays, functions, loops, objects, DOM manipulation, or other concepts that have not been taught yet

The solution should mainly use

Variables + User Input + Output + Comparison Operators +
Conditions + Logical Operators
